

Then what is the *ISSUE* in Aggregation

The issue is: Tight Coupling & No Dependency Injection

1 What we are doing here

- we are **creating Address objects**
- we are **creating Emp objects**
- we are **deciding which address goes to which employee**

Main method controls everything

2 Problems with this Approach

Tight Coupling

```
Emp e = new Emp(1, "Venkat", a1);
```

- Emp is tightly coupled to Address
 - If Address changes → Emp creation code changes
-

No Inversion of Control (IoC)

- Emp depends on Address
 - But **Emp does not get Address from outside framework**
 - main() controls dependencies
-

Hard to Change / Maintain

If tomorrow:

- Address comes from DB
- Address comes from API
- Address is shared

- Address format changes

You must **change Java code**, recompile, redeploy.
